

Development Environment Setup Planning

Access code: 918423

Larissa Vigil, Liria Zhang Hong, Zimo Chen

Project Scenario

Building a website for an online meal subscription system.

We will plan to build a website for an online meal subscription service, the website will contain:

1. The business' information and text
2. A log-in portal both for customers and clerks.
3. A page containing information about plans available.
4. A page containing images of the meals including descriptions, cost, and common allergens, able to filter through using special tags (i.e: vegetarian, nut-free, gluten-free, vegan)
5. Basic styling and navigation.
6. The site will be responsive and its layout will adjust according to what medium the user is viewing it on (computer, mobile, tablet)

The project will mainly use HTML, CSS, and JavaScript

Development Environment Planning

IDE / Code Editor: Visual Studio Code

We will be using Visual Studio Code as the main development environment because it supports all the languages we will need. It is free to use, and supports extensions for web development. It also has built-in Git integration.

Additional Tools:

Git

Git will be used for version control. As it will allow us to track all changes made to the files, restore previous versions if something breaks and it will also allow us to work on different features without over-writing each other's work.

GitHub

GitHub will be used to host the project online. This will allow both of us to access the latest version of the project, push and pull code changes, create separate branches and review each other's work. It will also keep a backup of the files online.

MongoDB

We will need a database to store and differentiate between our user accounts as well as the clerk accounts. It will help store our meals, and be used to filter through the different tags when customers are searching. It will help to store and keep track of product, orders and any other important information.

Jira

Jira will be used to keep track of the project's tasks and bugs. Team members will divide the work accordingly and track their progress.

Bootstrap

Bootstrap will be used to help create a responsive website as it is an already existing framework in order to make it easier on the team.

Web Browser

We will use Chrome or Firefox to test and preview the website. With a live preview we can check for page responsiveness and make sure all the CSS and images are working and interacting correctly.

Hardware Requirements

A decent computer to be able to run VSCode with at least 4GB RAM. Available storage is needed to save files and download the necessary IDEs. A modern web browser and internet connection are both needed to be able to access the chosen tools. A keyboard and mouse to be able to contribute to the code

Team Collaboration Needs

All team members will have access to the Jira account through their own profiles as well as the same GitHub repository. Each member should have a clone of the repository on their own computer. Tasks will be distributed through Jira and everyone will be responsible for specific portions of the project. There will be weekly team meetings to track progress and discuss what needs to be done for the upcoming week.

Set-up Time and Complexity

Tools	Set-up Time	Complexity
Visual Studio Code	5min	Easy, involves downloading the program
Git	5min	Easy, involves download the program
GitHub	45min	Medium, involves setting up an account, creating a repository and structuring your project

MongoDB	30min	Medium, involves opening an account which is quite simple, setting up your database may be a bit more complex
Jira	20min	Easy, involves opening an account, creating a project and inviting team members. Creating and assigning tasks is pretty straight-forward
BootStrap	15min	Easy, no account needed, only complexity comes from applying the templates
Web Browser	5min	Easy, most computers come equipped with a browser, not much is needed beyond opening it

Set-up Guide Creation

1. GitHub

- o Go to www.github.com and create an account
- o Create your repository with structured folders
- o Invite team members

2. Git

- o Go to <https://git-scm.com/install/>
- o Choose your operating system
- o Download & Install

3. Visual Studio Code

- o Search in browser or computer's store for 'Visual Studio Code'
- o Download & Install
- o Connect to GitHub via Git
- o Clone repository onto your computer

4. MongoDB

- o Go to <https://www.mongodb.com/>
- o Create an account
- o Set up databases including information needed

5. Jira

- o Go to [Jira.com](https://jira.com) or [Atlassian.com](https://atlassian.com)
- o Create an Account
- o Create a project
- o Invite team members
- o Set-up and divide tasks
- o Continuously re-visit and track progress
